

App Release Notes – 08.2026

Fully Released Features

A faster, more responsive map

The map was rebuilt around a single unified data model and one backend call, and now only loads the locations in view as you pan, with tiling and clustering to keep things smooth. The map opens quicker, stays legible in busy areas, and no longer feels sluggish.

Clearer, richer site and charger information

Redesigned site-detail screens (for both logged-in and guest users), updated pins, availability cards, status pills and a new map legend make charger status easy to read at a glance, loaded via faster endpoints. Drivers can quickly tell what's available and get the detail they need.

Easier to find the right charger

A reworked search bar, nearby-chargers tray and filters — including "Offers" and "Available Only" buttons — help drivers narrow the map to what matters to them.

Better on-screen feedback

Informational and error toasts were reworked and confusing prompts removed, so drivers get clearer, more relevant messages about what's happening.

A quicker, lower-friction onboarding process

The Add Name, Add Address and Add Payment steps were removed from onboarding for all new users. Address and payment information is now only collected within the RFID card ordering flow when a card is actually ordered. Drivers get from sign-up to using the app in fewer screens, with no details requested up front that they don't yet need.

Bug Fixes

Driver unable to complete payments

– app rejects all payment methods across 2 devices

We resolved an issue where some users were unable to complete payments regardless of the device or method used. All payment systems are now functioning correctly for affected accounts.

Issue with QR code taking customer to a different customers charge point

We fixed an issue where scanning a QR code could occasionally direct a user to the wrong charger at a different site. QR scanning is now precise and links to the correct hardware every time.

App Release Notes – 08.2026

Session in progress in-app screen not reflecting updates correctly

We fixed a bug where the "Session in Progress" screen was not updating with real-time data. You can now accurately track your live charging progress within the app.

App - social sign in navigation stack stuck

We fixed a navigation bug that occurred when using social sign-in (like Google or Apple). Users will no longer get stuck on the login screen after a successful authentication.

Visual and display fixes

We tidied up several small display issues: restored the missing left margin on the session statistics screen, fixed subscription names being cut off on iPhone 15 Pro, and hid parking fee information on the session summary when parking is free. Screens are now cleaner and easier to read.
