

Platform Release Notes –

06.2026

Fully Released Features

Portal & App MFA

To enhance account security and protect against unauthorized access, we have introduced Multi-Factor Authentication (MFA) for both the web portal and mobile app. Users can now secure their accounts using authenticator apps or email verification during the login process.

Order Cards: Step 1 (Quantity & Assignment Mode)

We have streamlined the RFID card ordering process by allowing operators to specify the number of cards needed and choose whether to assign them to specific drivers or the organization. This update includes a new "Order Cards" modal with clear pricing information and a simplified selection flow.

Order Cards: Step 2a (Assign to Driver)

To ensure ordered cards are correctly linked upon fulfillment, operators can now search for and select specific drivers during the ordering process. The new search functionality allows for quick identification of drivers by name or email, making the assignment process more efficient.

Refine Fleet Charts, Currency Formatting, and Fleet Card ID Wrapping

We have improved the consistency of the fleet management experience by aligning chart styles and standardizing currency formatting across the dashboard and driver details pages. These updates ensure that cost values are displayed accurately according to operator settings and that card IDs remain easy to read in data tables.

Fleet redirect from driver details page

To improve navigation efficiency, we have implemented a redirect that returns users to the fleet dashboard when they press the back button from a driver's details page. This change reduces the number of clicks required to manage multiple drivers within the fleet area.

Add a modified/updated timestamp field to the ChargerTimeline table.

To support more accurate uptime and reliability reporting, we have added an updated timestamp field to our charger tracking data. This allows our reporting systems to efficiently identify and pull only the most recent changes, ensuring data remains current without impacting system performance.

Platform Release Notes – 06.2026

Convert CurrentEnum for RolePermissions to Int

We have updated the internal data structure for user permissions to improve system performance and maintainability. This technical refinement ensures that the platform remains robust and scalable as we add more complex permission sets.

Add Payter settings to EMSP

We have integrated new payment terminal settings into our roaming services to expand the range of supported hardware for our partners. This update ensures that Payter devices can be correctly configured and managed within the ecosystem.

Bug Fixes

Location PUTs not sent to Radius (eMSP) over the charge card connection

We resolved an issue where location updates were not being correctly synchronized with the Radius roaming network. This fix ensures that charging station information remains accurate and up-to-date for drivers using the Radius network.
