Platform Release Notes – 10.2026

🚀 Fully Released Features

Show current vs average charging speed (avg & max kW) on portal session and charger pages
To help support teams diagnose underperforming chargers, we now display a comparison between the current session's speed and the charger's historical average. This allows for quick identification of whether a slow charge is due to a specific vehicle or a potential charger fault.

Populated internal/external private connection type column
We have enhanced our data visibility by populating the connection type column for private connections. This improvement ensures that internal and external connection details are clearly distinguished for better reporting.

Hub / NSP - update naming
We have refined the naming conventions within the portal to correctly identify Enapi and Gireve as hubs and other location services as NSPs. This update improves the accuracy of tooltips and interface labels for a more intuitive user experience.

Sort by revenue - add a sort by revenue
Users can now sort roaming partners by the revenue they generate, making it easier to identify top-performing partnerships. This feature provides better financial insights directly within the roaming management view.

Clarify Card Orders table labels and intro copy
To prevent confusion during bulk card orders, we have updated table headings to "Name" and "Email" and added clarifying tooltips. The new introductory text explains that single-driver orders show the driver, while bulk orders show the user who placed them.

Rename Drivers / Vehicles into Drivers and Vehicles
We have renamed the "Drivers / Vehicles" section to "Drivers and Vehicles" to improve accessibility and clarity. This simple change makes the navigation more intuitive for all users.

Add comments to Problems
To improve collaboration on system issues, we now support adding comments directly to "Problems," with these comments automatically syncing to any linked child issues. This ensures that all relevant information is shared across the entire issue hierarchy.

Platform Release Notes – 10.2026

Add AssignedAt field to Issues
We have added a new timestamp field to track exactly when an issue is assigned or updated, providing better visibility into response times. This data will help teams monitor and improve their issue resolution workflows.

Redo the handshake process
We have updated and re-executed the roaming handshake process for key partners to ensure compatibility with our latest OCPI 2.2 endpoints. This refresh maintains stable and secure connections for our roaming network.
