

# Platform Release Notes – 01.2026

## Released Features

### **Sim Visibility in the portal**

You can now view SIM status and data usage directly in the portal, making it easier to monitor your hardware and stay on top of connectivity. This feature is in beta as we continue to improve data coverage.

### **Mandatory onboarding flow – make it clear which fields are mandatory**

The onboarding process now clearly highlights which fields are required, helping you complete setup faster and with fewer errors. This ensures a smoother start for new users.

### **Pay and charge responsiveness improvements**

We've streamlined the process for retrieving charger information, making pay and charge operations much faster and more efficient for users. This improvement ensures a smoother and speedier charging experience.

### **Public API 'tags' filter**

Operators can now access data for tagged sites via an enhanced API feed, including new query parameters for site-specific session lookups. This streamlines data reporting for site operators.

## Bug Fixes

### **Issue Log – Charger Column Alignment**

The charger column in the issue log is now properly aligned, improving readability and consistency.
