

Platform Release Notes – 05.2026

Fully Released Features

ACP Profile Details FE Improvements

We have enhanced the Access Control Profile details page to provide a clearer and more comprehensive view of profile configurations. Operators can now easily see active status, public access settings, time availability, and detailed user and site assignments in a more intuitive layout.

Portal MFA – get live policy ready with MFA code

We have prepared the live security policies to support multi-factor authentication codes within the portal. This is a key step in enhancing the security of user accounts and protecting sensitive data.

Align MW3 error logs with MW2

We have standardised error logging across our middleware services to ensure consistent monitoring and troubleshooting. This alignment makes it easier for our engineers to identify and resolve issues across different parts of the system.

Bug Fixes

Charger Flow – Connector Name Validation Unclear When Auto-Generated Name Exceeds 16 Characters

We improved the validation messages in the charger setup flow to clearly explain when a connector name is too long, preventing users from getting stuck.

Add admin-only Reset MFA control to user management page in portal

We added a new tool for administrators to reset a user's multi-factor authentication, allowing for easier account recovery when a device is lost.
